5. Create a program to delete the file if it exists, and create it again?

Code:

```
import java.io.File;
import java.io.IOException;

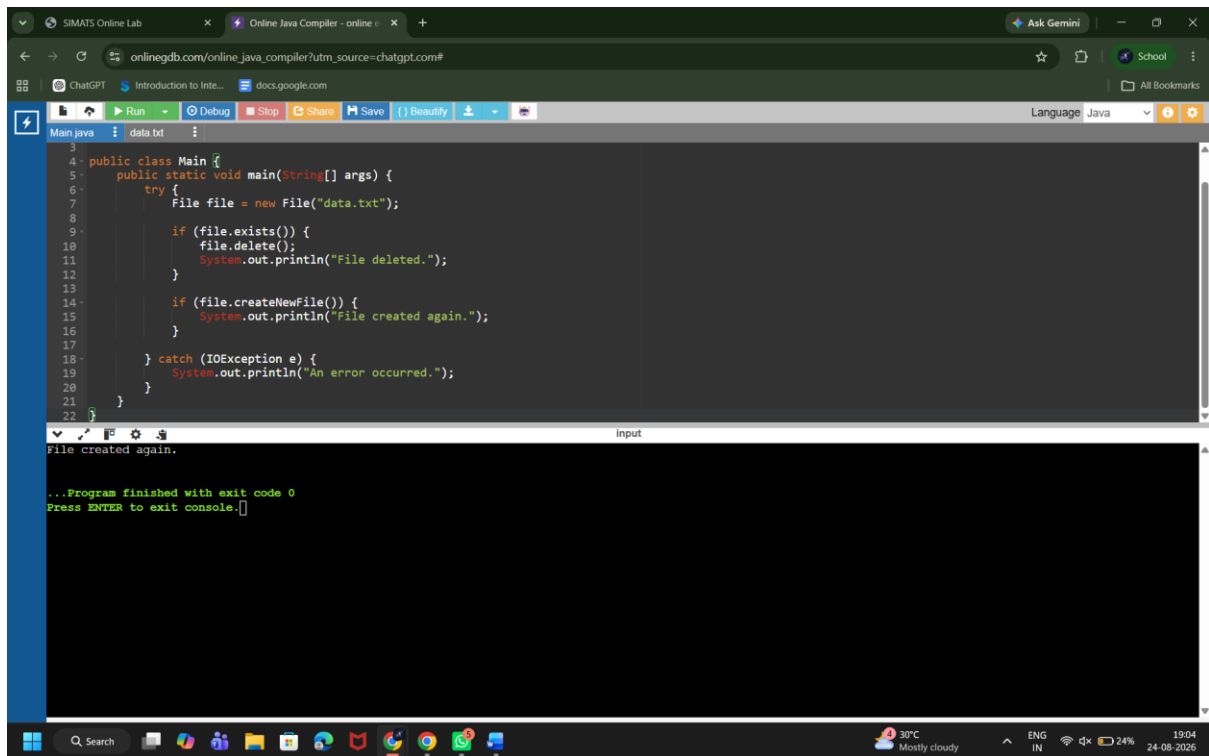

public class Main {
    public static void main(String[] args) {
        try {
            File file = new File("data.txt");

            if (file.exists()) {
                file.delete();
                System.out.println("File deleted.");
            }

            if (file.createNewFile()) {
                System.out.println("File created again.");
            }

        } catch (IOException e) {
            System.out.println("An error occurred.");
        }
    }
}
```

Output:

The screenshot displays an online Java compiler interface. The top section shows the source code for a Java program named 'Main.java'. The code checks for the existence of a file named 'data.txt'. If the file exists, it is deleted, and the message 'File deleted.' is printed. If the file does not exist, it is created, and the message 'File created again.' is printed. The program includes a try-catch block to handle any IOExceptions.

```
3
4 public class Main {
5     public static void main(String[] args) {
6         try {
7             File file = new File("data.txt");
8
9             if (file.exists()) {
10                file.delete();
11                System.out.println("File deleted.");
12            }
13
14            if (file.createNewFile()) {
15                System.out.println("File created again.");
16            }
17
18        } catch (IOException e) {
19            System.out.println("An error occurred.");
20        }
21    }
22 }
```

The bottom section shows the output of the program. The first line is 'File created again.' followed by '...Program finished with exit code 0' and 'Press ENTER to exit console.'

File created again.

...Program finished with exit code 0
Press ENTER to exit console.
